

Digital Signal Intelligence (DSI)

A New Information Substrate for Insurance

THE PRECEDENT

DSI is not an experiment. It is the latest evolution of a 30-year methodology that has revolutionised every major global industry by shifting from self-reported data to relational intelligence.

A REVOLUTIONARY INSIGHT

The Challenge	Search engines ranked pages by counting keywords. Result: Spam, page-gaming, and irrelevant results dominated search.
The Solution	Larry Page and Sergey Brin realised that a page's value isn't in its text, but in its citations, who links to it and the quality of those links and created PageRank.
The Result	Google captured 92% of the search market by prioritising the Digital Citation Network over content.

GRAPH PROPAGATION

Between 1998 and 2020 digital citation algorithms have proven successful across every industry.

Consumer Finance (FICO)	Recorded Future	Palantir and JP Morgan
Application: Credit scoring now incorporates digital signals like transaction graphs.	Application: Predict Cyber attacks by analysing digital signals like the dark-web.	Application: Analyse digital signals to identify fraud and money laundering.
Result: Default prediction accuracy improved by 35-40% over the traditional model.	Result: Threats are detected 6-8 weeks earlier than traditional methods.	Result: Reduction of false-positives by 50% and increase valid identification by 20%.

THE BIRTH OF MODERN AI

Today, the principles established by PageRank have evolved into Modern AI constructs..

The Evolution	Modern AI uses a mechanism called "Self-Attention." Just as PageRank assigns importance to web pages based on links, Transformers assign importance to words (tokens) based on their relationship to every other word in a sequence.
The Connection	A Transformer is essentially a dynamic, high-speed PageRank that happens in milliseconds. It ignores "noise" and focuses on the "signals" that matter most to the context.
The Link	Digital Signal Intelligence applies this "Attention" logic to the insurance market—treating 650B+ indexed signals as a massive neural network to identify risk.

THE NEXT FRONTIER

Beyond Transformers, the next frontier is World Models. While a Transformer reads context, a World Model simulates the environment's future.

DSI is the World Model for Insurance. It uses 650B+ signals to build a predictive simulation of an organisation's 'Hidden State,' allowing us to see a loss event in the digital substrate before it manifests in the physical world.

THE BOTTOM LINE

Not Experimental.
It is the same methodology used by Amazon for recommendations (2002), LinkedIn for recruitment (2011), and modern AI applications from OpenAI, Google, and Anthropic being developed today. Insurance is the outlier.

Scale.
We are tapping into 1.1B websites, a thriving API economy, used by the rest of the world already.

Reach.
Almost every entity has a web-presence. For example, 85% of mid-market companies have a meaningful web footprint

Predictive Power.
From predicting cyber-attacks to predicting loan defaults, signal-based analysis is the global gold standard.
