

# Digital Signal Intelligence (DSI)

## A New Information Substrate for Insurance

### THE PRECEDENT

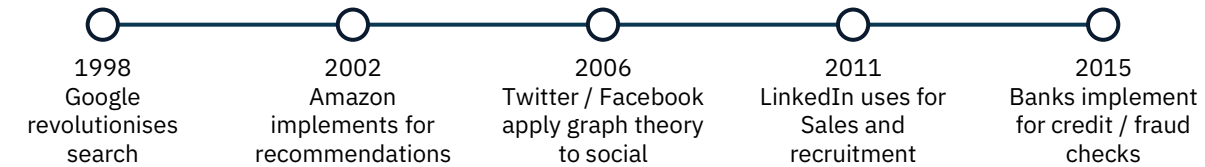

DSI is not experimental, it's based on a proven methodology, baked into the fabric of the modern and future web, which has already revolutionised multiple industries.

### A REVOLUTIONARY INSIGHT

|               |                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The Challenge | Search engines ranked pages by counting keywords. Result: Spam, page-gaming, and irrelevant results dominated search.                                                           |
| The Solution  | PageRank. Don't analyse what pages say about themselves; analyse who links to them and the quality of those links. A page linked by trusted sources must itself be trustworthy. |
| The Result    | Google proved that analysing digital citation networks outperforms analysing self-reported content.                                                                             |

### MASS ADOPTION AND PROVEN SUCCESS

Since it's introduction in 1998, PageRank principles have quickly propagated.

And today almost every industry uses similar methodologies. For example;

|                                                                                       |                                                                                                 |
|---------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| FICO and Credit Bureaus Consumer Finance                                              | Recorded Future                                                                                 |
| Application: Credit scoring now incorporates digital signals like transaction graphs. | Application: Predict Cyber attacks by analysing digital signals like the dark-web.              |
| Result: Default prediction accuracy improved by 35-40% over the traditional model.    | Result: Threats are detected 6-8 weeks earlier than traditional methods.                        |
| Palantir and JP Morgan                                                                | Dun and Bradstreet                                                                              |
| Application: Analyse digital signals to identify fraud and money laundering.          | Application: Analyse digital signals to create credit-scores.                                   |
| Result: Reduction of false-positives by 50% and increase valid identification by 20%. | Result: 90% of Fortune 500 use D&B in B2B decision-making.                                      |
| ZoomInfo and LinkedIn                                                                 | Enigma Technologies                                                                             |
| Application: Score companies by digital signals to predict sales opportunities.       | Application: Uses digital signals to underwrite loans instantly.                                |
| Result: \$2B+ ARR business built entirely on digital signals.                         | Result: 2-3x increase in approval rates with no increase in loss compared to traditional model. |

### THE DIRECT ANALOGY TO DSI

|           | 1998 Google PageRank                  | 2026 DSI                                                         |
|-----------|---------------------------------------|------------------------------------------------------------------|
| Challenge | Who's trustworthy and authoritative?  | Who's the lowest risk?                                           |
| Solution  | Analyse the digital citation network. | Infer risk by using and augmenting the digital citation network. |
| Result    | 92% global search market share.       | A 22% expense-ratio decrease.                                    |

### THE BOTTOM LINE

The web has fundamentally restructured to allow this type of analysis with 85% of mid-market companies having a meaningful web footprint, and almost every company, even the very smallest, having a presence. There are now 1.1B websites globally, 650B+ indexed digital signals, and a thriving API economy. Insurance is the last industry to recognise this.
